

Technical Auditor — Desktop Application Pre-Release Review

Engagement type: Fixed-scope contract **Duration:** 2–4 weeks **Work style:** Async-first, with sync checkpoints

About the Project

We are building a desktop application with a Python backend (FastAPI, Pydantic, SQLite), a TypeScript/React frontend, and Electron for desktop packaging. The application is data-intensive, with structured input, a deterministic calculation engine, and Excel report export.

It has been built primarily through LLM-assisted development (Claude Code). This is relevant to the review — it shapes the kinds of structural risks the codebase carries.

The Engagement

We are looking for a senior technical reviewer to independently assess the application before its first beta release. The scope covers code quality, architecture, persistence design, API robustness, cross-layer integration, Electron packaging, and structural risk.

You would receive onboarding documentation, run the application locally, conduct your review, and deliver a written findings report with severity-ranked items. The engagement closes with a working session to walk through critical and major findings.

This is a review role. You are not writing features, joining standups, or becoming part of the development team.

What We're Looking For

You should be strong in:

- Python application development — FastAPI, Pydantic v2, SQLite persistence, packaging and distribution
- Electron — main/renderer architecture, IPC, Python sidecar bundling, auto-update, code signing, security surface
- Reviewing LLM-generated codebases — recognizing copy-paste drift, documentation-to-code divergence, over-scaffolded abstractions, and tests that may share assumptions with the code they cover

Also valuable:

- TypeScript/React proficiency
- Experience tracing data contracts across tiers and identifying where things can silently break
- Security review capability (OWASP top 10, dependency auditing, Electron-specific concerns)
- Familiarity with Excel/OOXML export pipelines

Deliverables

- Severity-ranked findings report
- Prioritized remediation backlog
- One working session to discuss findings
